

Week 6 — Databricks Project (Exercise 6)

The Databricks version of the local PySpark lab, for **Exercise 6**. It runs the same DataFrame / medallion / time-travel flow on a real Databricks workspace.

What's here

- `week6_databricks_lab.py` — a **Databricks notebook source** file (imports as a notebook in the workspace).

How to run

- Create a free workspace — see `../environment/databricks/readme.md` (**Databricks Free Edition**, no cloud account or credit card).
- In the workspace sidebar: **Workspace** → **Import** and upload `week6_databricks_lab.py`. It opens as a notebook.
- Attach it to **serverless compute** (selector at the top of the notebook).
- Run All**.

What differs from the local notebook

Local (<code>code/week6_databricks_notebook.ipynb</code>)	This project
Builds a SparkSession with <code>configure_spark_with_delta_pip</code>	Uses the <code>spark</code> Databricks already provides
Writes Delta to <code>/home/jovyan/work/delta/...</code>	Managed Unity Catalog tables in <code>workspace.default</code>
History/time travel via <code>DeltaTable.forPath(...)</code>	<code>DESCRIBE HISTORY / VERSION AS OF</code> in <code>%sql</code>

Everything else — the data, the medallion logic, and the expected output — is identical. `VERSION AS OF 0` shows `amount = 120.50` for `order_id 1`; the current version shows `121.50`.
